FIND WHAT'S

Next View Cloud

- Engineered Labor Standards
 - PF&D
 - Frequencies
 - MOST
 - MTM
 - MSD
- XYZ & Travel Calculations
- Productivity & Utilization Reporting
- Real-time Dashboards & Charts
- Direct & Indirect Labor Tracking
- Workforce Planning & Scheduling
- Coaching & Mentoring
- Observation Management
- Single & Multi-variable Standards
- On-Demand/SaaS Platform

"Labor Management Systems need to plan tomorrow and manage today and not just report on yesterday."

What does a LMS do?

- Yesterday
- Tomorrow
- Today

Yesterday

- Captures Performance Data
 - Efficiency (% of standard)
 - Utilization (direct vs indirect)
- Calculate data for incentive based pay
- Essential tool for worker review
- Maintain historical data (Costing, KVI)

Fair Standard

- Single Variable Standard units or lines/hour
- Engineered Standard discrete steps including travel

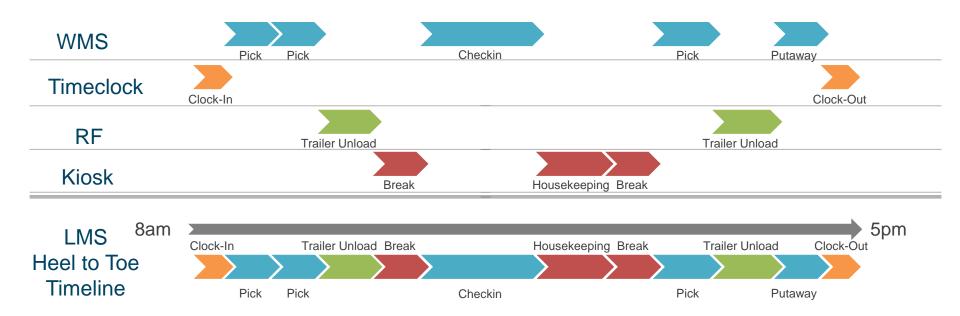

- Cart A
 - 20 lines
 - 28.30 minutes
- Cart B
 - 35 lines
 - 24.32 minutes

Heel to toe timeline for each worker

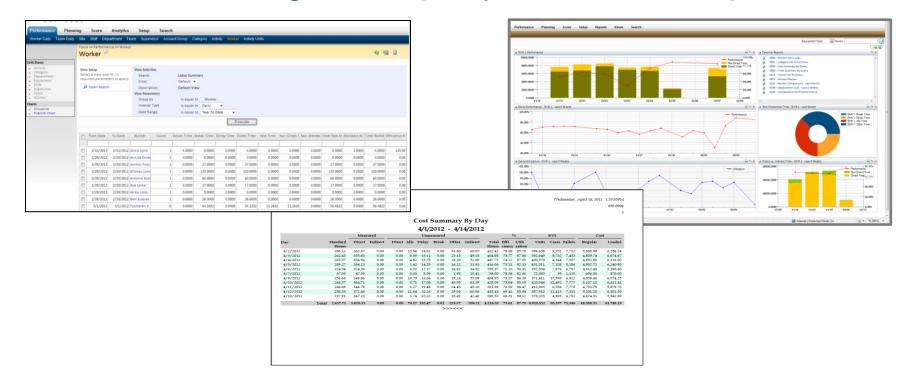

Business Intelligence: query, chart, and report

Requirements to Capture Yesterday's Data

- Real-time interface not important
- Data can be download every 5 minutes or once a day
- Engineered standards create more accurate data but not a requirement
- Requires maintenance to keep engineered standards accurate
- But what about tomorrow and today?

Tomorrow

- Plan future labor requirements
 - Maintain historical labor rates
 - Input forecast and actual demand
 - Estimate planned labor activities
- Plan FTE by work center
- Estimate temps and overtime

Requires Multi-Level Planning

- Model Data
 - Historical orders
 - ERP Level Data
 - Orders scheduled
 - Actual Demand Orders
 - Customer orders
- Continuous Planning Process

Fill In Missing Activities

- Create additional activities
 - Replenishment, Putaway, Loading
- Estimate sub-activity type
 - RF vs Fluid Receiving, Pick by Light vs Paper
- LMS can provide historical data

Determine Planning Rates

- What is the rate for receiving, putaway, picking loading?
- LMS can determine based on historical data
 - Performance
 - Utilization

Requirements to Plan Tomorrow's Data

- Real-time interface not important
- Can use non-engineered standards
- Based on aggregate FTE per department
- Don't need employee roster
- But what about today?

Today

- Manage today's labor requirements
 - Monitor real-time work center performance
 - Assign workers based on demand
 - Estimate goal time
 - Show percentage of completion
- Manage budget for temps and overtime

Goal Time

- Based on actual demand data
 - inbound PO
 - pick list
- Utilize engineered standard
 - multi-variable (volume, weight)
 - travel
- Very accurate estimate of future activities

Assign Workers to Activities

- Workers assigned to actual labor activities based on goal time estimate
- Activities can be discrete or aggregated by time
- Show percentage of completion
- Need for workers in different work centers

Challenge: Different Assignment Models

- Discrete labor activities
 - Assign to inbound/outbound load, pick list
 - Case/pallet warehouse
- Time based activities
 - Aggregate by time and work center
 - Assign worker to center for fixed time period (10-11am)
 - E-commerce warehouse
- Hybrid facility
 - Some areas are discrete and some are time based
 - Retail warehouse

Requirements to Track Today's Data

- Real-time interface is essential for both actual demand and performance data
- Need engineered standards to accurately calculate goal time

Most Important!

Need to integrate into workforce scheduling to manage workers

What is the state of the art technology used to schedule workers in warehouses?

We asked our customers

Amazing use of spreadsheet technology

Spreadsheet Scheduling

- Model work center labor rates and capacity
- Input future workload
- Breakdown future workload by work center
- Estimate FTE per work center
- Assign workers to schedule based on need
- Record actual labor and calculate daily costs

Spreadsheet Limitations

- Not integrated to HR or ERP or WMS
- Manually maintain work roster including days off, etc
- Calculate historical labor rates
- Determine labor activity breakdown models
- Input actual demand
- Record time clock data

Huge clerical effort but also significant overlap with LMS functionality

Additional Features in LMS for Workforce Scheduling

- Maintain worker roster with skills, department info
- Create weekly, daily shift schedule
- Store HR data such as wage, vacation, days offs
- Maintain both full and temp roster
- Interface to HR systems
- All labor planning features already built-in to LMS

Integrated LMS/Workforce Scheduling

- Tomorrow's data
 - Model based on historical performance data
 - Input forecast and actual demand
 - Estimate FTE by work center
 - Assign workers to weekly/daily shift schedule
 - Continuous model as demand changes
 - Re-assign workers based on demand

Integrated LMS/Workforce Scheduling

- Today's data
 - Manage real time worker levels per work center
 - Calculate goal time based on actual demand data
 - Aggregate demand by work center based on scheduled time
 - Assign workers to either discrete activities or work centers
 - Monitor percentage of completion
 - Move workers based on need

Integrated LMS/Workforce Scheduling

- Yesterday's data
 - Record actual time clock data for each worker
 - Calculate worker performance data
 - Generate labor costs by work center
 - Compare to budgeted costs
 - Maintain historical data for future planning

Benefits of Integrated LMS and Workforce Scheduling

- Workforce scheduling is currently done with spreadsheets
- Very time consuming for warehouse staff
- Accurate labor scheduling for tomorrow and today
- Reduce overtime and temp costs
- Manage labor costs in real-time

Possible LMS Implementation Approaches

Planning First

or

Performance First
